**Abstract**

The purpose of this study was to determine whether the use of a computerized decision support system (DSS) could improve the performance of a group of experts in a complex task. The task was to diagnose a simulated patient with a rare disease. The DSS provided information about the patient's history, physical examination, and laboratory tests. The DSS also provided a list of possible diagnoses and their associated probabilities. The results showed that the use of the DSS improved the accuracy of the diagnosis and reduced the time taken to reach a diagnosis.
